

Abstract Of The Disclosure

A security module for a motor vehicle security device includes a module housing, a belt take-up roller for the taking up onto, and the unwinding therefrom, of a safety belt operable to belt in a seat occupant seated in a vehicle seat in the motor vehicle, and a side airbag module having an airbag inflatable into a deployed position in which it provides lateral support for the seat occupant. The side airbag module also includes an associated gas generator for supplying compressed gas to effect deployment of the airbag. The take-up roller, the safety belt, and the side airbag module are commonly mounted in the module housing, which can be mounted relative to the seat back of the vehicle seat either during installation of the vehicle seat itself during the vehicle production or as an aftermarket installation.
